

Week 4 Project Summary

- This week's specific problem for the data analytics track was to understand the HealthConnect_Appointment_Data dataset and identify how it can be used to investigate attendance and no-show patterns.
- Upon using SQL to determine the quality of the data in the dataset, 5001 rows and 18 columns were discovered. This also revealed inconsistencies in data formatting and missing values from several columns. However, there were no duplicates in the appointment id column which uniquely identifies each set appointment.
- For my project, the following weeks are going to consist of data cleaning in SQL, exploratory data analysis (also in SQL) and finally visualisation using Tableau.
- Key considerations that may affect my project include possible loss of key information during data cleaning that may lead to inaccuracy of the results. The resulting patterns may also be too irregular thus limiting the ability to determine a distinct solution to our business problems.
- For the coming week, data cleaning seems like the next most plausible step in our data analysis. This is where we are going to prepare the data for analysis by handling missing values, fixing data types and creating key fields.
